Poster No. 2937

Background

- R-CHOP is curative in 60–70% of patients with diffuse large B-cell lymphoma (DLBCL),^{1,2} while 30–40% experience a relapsed/refractory (R/R) disease course^{2,3}
- Patients with R/R disease are often ineligible for second-line CAR T-cell therapy or intensive chemotherapy and autologous stem-cell transplant (ASCT) due to advanced age or comorbidities;^{3–7} additionally, 40–65% of patients relapse after ASCT or CAR T-cell therapy^{6–10}
- Tafasitamab is a humanized, Fc-modified, anti-CD19 monoclonal antibody that functions as an immunotherapy through direct cytotoxicity, antibody-dependent cellular cytotoxicity and antibody-dependent cell-mediated phagocytosis^{11,12}
- Tafasitamab + lenalidomide (LEN) demonstrated efficacy in ASCT-ineligible patients with R/R DLBCL in the ongoing, open-label, multicenter, single-arm Phase II L-MIND study (NCT02399085)¹
- In combination with LEN, tafasitamab has been granted accelerated approval in the United States (July 2020)¹¹ and conditional/accelerated approval by the European Medicines Agency (August 2021)¹² and other regulatory authorities for the treatment of adult patients with R/R DLBCL not otherwise specified, including DLBCL arising from low-grade lymphoma, and who are ineligible for ASCT, and is a preferred regimen in the NCCN Clinical Practice Guidelines in Oncology (NCCN Guidelines[®]) in this setting¹⁴
- A long duration of response (DoR), meaningful overall survival (OS), and a well-defined safety profile was reported in L-MIND patients after ≥35 months' follow-up (overall response rate: 57.5% [46/80 patients]; median DoR: 43.9 months; median OS: 33.5 months)¹⁵
- Here, we report efficacy and safety data for tafasitamab + LEN in patients with R/R DLBCL enrolled on L-MIND who received treatment for ≥2 years and those patients in follow-up for ≥ 5 years

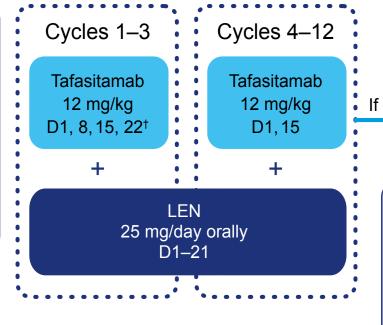

Methods

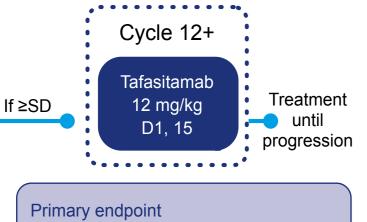

Study design

- Patients aged \geq 18 years with R/R DLBCL (1–3 prior systemic therapies, including ≥1 CD20-targeting regimen), with an Eastern Cooperative Oncology Group performance status of 0–2, and who were ineligible for ASCT were enrolled¹¹ (Figure 1)
- Patients received tafasitamab + LEN, followed by tafasitamab monotherapy
- Tafasitamab was administered over 28-day cycles (12 mg/kg intravenously), once weekly during Cycles (C) 1–3, with a loading dose on Day 4 of C1, then every 2 weeks (Q2W) during C4–12
- LEN (25 mg orally) was administered on Days 1–21 of C1–12
- Following Cycle 12, progression-free patients received tafasitamab Q2W until disease progression
- The primary endpoint was objective response rate (ORR), assessed by an independent review committee, based on the 2007 International Working Group response criteria¹⁶
- Secondary endpoints included investigator-assessed ORR, DoR, progression-free survival (PFS), and OS; safety endpoints included incidence and severity of adverse events (AEs)

Figure 1. Study design

- R/R DLBCL Not eligible for HDC plus ASCT 1–3 prior regimens
- Primary refractory patients were not eligible
- ECOG PS 0–2
- N=81 patients

- ORR (central read Secondary endpoints
- Safety of the tafasitamab plus LEN
- combination
- Exploratory and biomarker-based

*Primary refractory is defined as no response to, or progression/relapse during or within 6 months of, front-line therapy; 15 refractory patients were included under an early version of the protocol. [†]A loading dose of tafasitamab was administered on Day 4 of Cycle 1

ASCT, autologous stem cell transplant; D, days; DLBCL, diffuse large B-cell lymphoma; DoR, duration of response; ECOG PS, Eastern Cooperative Oncology Group performance status; HDC, high-dose chemotherapy; LEN, lenalidomide; ORR, objective response rate; OS, overall survival; PFS, progressionfree survival; R/R, relapsed or refractory; SD, stable disease.

*At study entry. [†]Refractory to previous line is defined as having less than a partial response to the most recent systemic therapy. [‡]Primary refractory defined as no response to or progression/relapse during or within 6 months of front-line therapy; primary refractory patients had a DoR to 1L of 3–6 months. 1L, first line; DoR, duration of response; GCB, germinal center B-cell; IHC, immunohistochemistry; IPI, International Prognostic Index; LDH, lactate dehydrogenase; SCT, stem cell transplant.

• Of 81 patients enrolled in L-MIND, 80 received ≥1 dose of tafasitamab + LEN and were included in the full analysis set (FAS) for efficacy; all 81 patients were

• At the data cut-off date (February 15, 2022), 30 patients completed 12 cycles of tafasitamab + LEN and four patients discontinued LEN before 12 cycles; 27 (34%) received treatment for ≥ 2 years (median: 4.3 years) (**Figure 2**)

• Of these 27 patients, 23 are confirmed alive, one died from an unknown cause, two died following AEs unrelated to study treatment, and one was lost to follow-up

Thirteen patients remain on treatment; 14 patients discontinued the treatment

Death* (n=1) Progressive disease/relapse (n=4) Withdrawal by patient (n=5)

 Baseline characteristics between the safety analysis set and the patients who received treatment for ≥ 2 years were similar

• In the patients who received treatment for ≥ 2 years, median age was 71 years (range, 41–81 years), eight patients (30%) had high-risk disease (International Prognostic Index score 3–5), and 19 patients (70%) had Ann Arbor stage III–IV

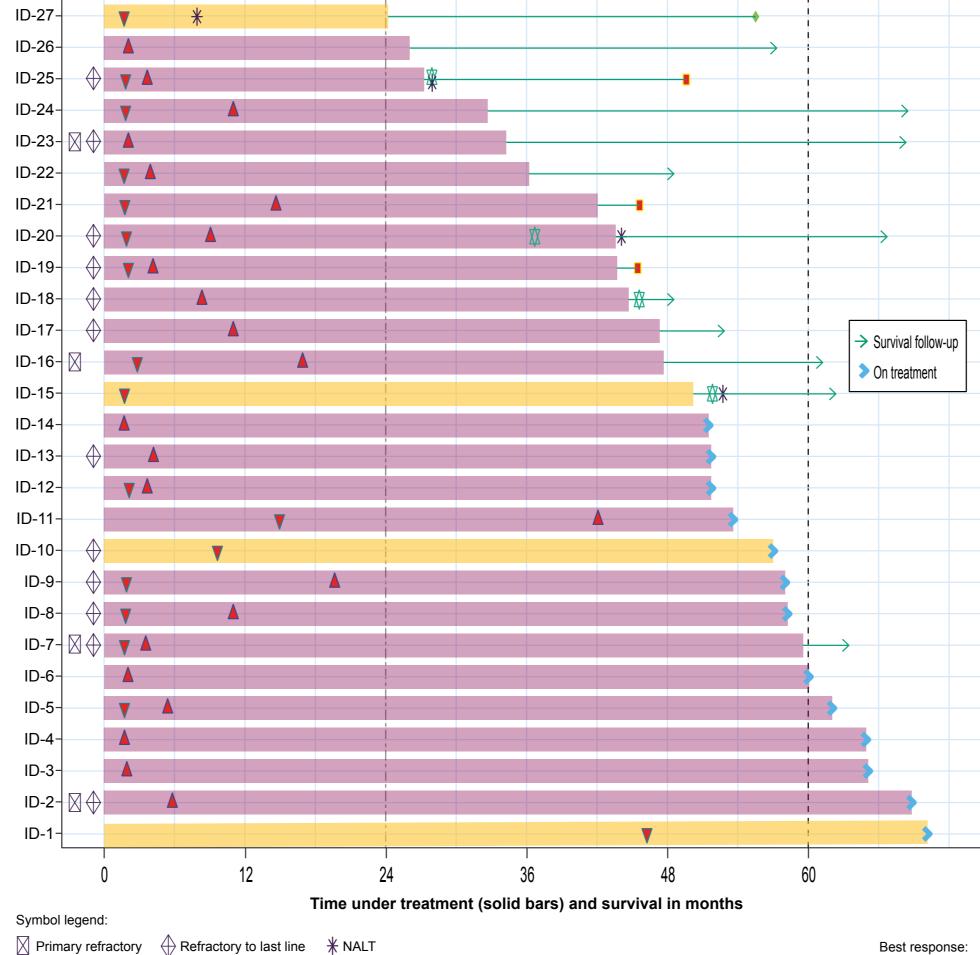

• The proportion of patients who were primary refractory, refractory to previous therapy, or who had received prior ASCT were similar between patients who received treatment for ≥ 2 years and the FAS (**Table 1**)

Efficacy (investigator-assessed)

- A complete response (CR) as a best response was achieved by 23 of 27 patients, including the patients who were primary refractory (**Figure 3**)
- on treatment
- The 48-month OS rate was 92.6%; however, the median OS, PFS, and DoR were not reached (**Figure 4A–C**)
- Of 12 patients refractory to a previous therapy line, 11 (91.7%) were in follow-up at 48 months
- Twelve patients have been in OS follow-up for ≥5 years; of these, six are still on treatment, while six have discontinued treatment
- Of the six patients who received treatment for ≥ 5 years, five achieved CR (one of whom had triple-hit R/R DLBCL [patient ID-7]) and one had a PR
- All of the primary refractory patients (n=4) are in follow-up at 60 months

Figure 3. Treatment response in patients treated for ≥2 years

ID-19, reason for treatment discontinuation was due to withdrawal by patient. The difference in arrow type signifies the transition from on-treatment to off-treatment. Thick arrows indicate on-treatment, while thin arrows indicate off-treatment CR, complete response; NALT, non-protocol specified antilymphoma treatment; PD, progressive

disease; PR, partial response,

Safety

- The safety analysis of the 27 patients who received treatment for ≥ 2 years with tafasitamab + LEN therapy (C1–12) and tafasitamab monotherapy (C13–24) by exposure-adjusted incidence revealed a lower incidence of AEs during the tafasitamab monotherapy phase compared with the combination therapy phase; the low incidence of AEs was maintained during the tafasitamab monotherapy phase from 2 years onwards (Cycle \geq 25), with no new safety signals reported (Figure 5)
- The majority of AEs were Grades 1–2
- Neutropenia, thrombocytopenia, leukopenia, and anemia were the most common hematologic AEs, while diarrhea, bronchitis, pyrexia, muscle spasms, and peripheral edema were the most common non-hematologic AEs in the combination phase
- This incidence of all AEs substantially declined in the tafasitamab monotherapy phase
- Exposure-adjusted AE comparison showed a reduced AE frequency in the C13–24 tafasitamab monotherapy period following the C1–12 combination therapy phase

- Four patients achieved a partial response (PR), of which two were still
